## Problem 0

A topological space  $(X, \mathcal{T}_X)$  is pseudocompact  $\iff$  every continuous function  $f: (X, \mathcal{T}_X) \to (\mathbb{R}, \mathcal{T}_{\varepsilon^1})$  is bounded. Here  $\mathcal{T}_{\varepsilon^1}$  is the usual topology over  $\mathbb{R}$ .

- (i) Show that pseudocompactness is a continuous invariant. Explain.
- (ii) Show that if  $(Y, \mathcal{T}_Y)$  is compact, then  $(Y, \mathcal{T}_Y)$  is pseudocompact, but that the converse does not hold.

## Proof (i):

Let  $(X,\mathcal{T}_x)$  be a pseudocompact topological space, and let  $\varphi:(X,\mathcal{T}_X) \to \left(\varphi(X),\mathcal{T}_{\varphi(X)}\right)$  be a continuous function. Now let  $f:\left(\varphi(X),\mathcal{T}_{\varphi(X)}\right) \to (\mathbb{R},\mathcal{T}_{\varepsilon^1})$  be a continuous function. Then  $(f\circ\varphi):(X,\mathcal{T}_X)\to (\mathbb{R},\mathcal{T}_{\varepsilon^1})$  is continuous. But  $(X,\mathcal{T}_X)$  is pseudocompact, so  $f\circ\varphi$  is bounded  $\Longrightarrow f$  is bounded. Then  $\left(\varphi(X),\mathcal{T}_{\varphi(X)}\right)$  is pseudocompact.

: pseudocompactness is a continuous invariant.

#### **MEP**

## Proof (ii):

We claim that  $(Y, \mathcal{T}_Y)$  compact  $\Longrightarrow (Y, \mathcal{T}_Y)$  pseudocompact, we show the contrapositive.

Suppose that  $(Y,\mathcal{T}_Y)$  is not pseudocompact, then there exists a continuous function  $f:(Y,\mathcal{T}_Y)\to (\mathbb{R},\mathcal{T}_{\varepsilon^1})$  that is unbounded. Then f(Y) extends infinitely in at least one direction. Suppose, without loss of generality, that it extends infinitely to the right. Then  $f(Y)\subseteq (a,+\infty)$ , for some  $a\in\mathbb{R}\cup\{-\infty\}$ . Now define the family  $\{(a,i)\}_{n=1}^\infty$  and note that:  $\bigcup_{i=1}^\infty (a,i)=(a,+\infty)\supseteq f(Y)$ . But note that  $(a,i)\in\mathcal{T}_{\varepsilon^1}, \forall i\in\mathbb{N}\Longrightarrow f^{-1}((a,i))\in\mathcal{T}_Y, \forall i\in\mathbb{N}$  because f is continuous. And:

$$\bigcup_{i=1}^{\infty} f^{-1}((a,i)) = f^{-1}\left(\bigcup_{i=1}^{\infty} (a,i)\right) = f^{-1}((a,+\infty)) \supseteq f^{-1}(f(Y)) \supseteq Y \tag{1}$$

This implies that the collection  $C:=\{f^{-1}((a,i))\cap Y\mid i\in\mathbb{N}\}$  is an open cover for Y, but note that, for any finite subcollection  $C':=\{f^{-1}\big((a,i_j)\big)\mid i_j\in\mathbb{N},\ \forall j\in\{1,...,n\}\}\subseteq C$ , there exists a natural number n such that  $i_n$  is an upper bound of C'. But f(Y) extends infinitely to the right, so C' cannot be an open cover for Y.

 $\therefore (Y, \mathcal{T}_Y)$  is not compact.

Now we show that the converse does not hold.

Consider the collection:  $\mathcal{T}:=\{U\subseteq\mathbb{R}\mid U=\emptyset\lor 0\in U\}$ . Note that  $\emptyset\in\mathcal{T}$  by construction and  $0\in\mathbb{R}\Longrightarrow\mathbb{R}\in\mathcal{T}$ , and that arbitrary unions and finite intersections of sets containing 0 also contain 0. Then  $\mathcal{T}$  is a topology over  $\mathbb{R}$ . Suppose  $f:(\mathbb{R},\mathcal{T})\to(\mathbb{R},\mathcal{T}_{\varepsilon^1})$  is a continuous function. Then, since  $\mathbb{R}\setminus\{f(0)\}=(-\infty,0)\cup(0,+\infty)\in\mathcal{T}_{\varepsilon^1}$ , we have that  $A:=f^{-1}(\mathbb{R}\setminus f(\{0\}))\in\mathcal{T}$ . But note that  $A=f^{-1}(\mathbb{R}\setminus f(\{0\}))=f^{-1}(\mathbb{R})\setminus f^{-1}(f(\{0\}))=\mathbb{R}\setminus f^{-1}(f(\{0\}))$ , and  $\{0\}\subseteq f^{-1}(f(\{0\}))$ , it then follows that  $0\notin A$ , but  $A\in\mathcal{T}$ , therefore  $A=f^{-1}(\mathbb{R}\setminus f(\{0\}))=\emptyset$ . This implies that f doesn't ever map to anything other than 0, so f(x)=0, which is a bounded function.

 $\therefore$  ( $\mathbb{R}$ ,  $\mathcal{T}$ ) is pseudocompact.

Consider the collection  $D \coloneqq \{(-i,i) \mid i \in \mathbb{N}\}$ . Note that  $\forall i \in \mathbb{N}, \ 0 \in (-i,i) \Longrightarrow (-i,i) \in \mathcal{T}$ . Also,  $\bigcup_{i=1}^{\infty} (-i,i) = \mathbb{R}$ . Therefore, D is an open cover for  $\mathbb{R}$ . Now take a finite subcollection  $D' \coloneqq \left\{ \left(-i_j, i_j\right) \mid i_j \in \mathbb{N}, \ \forall j \in \{1, ..., n\} \right\} \subseteq D$ . But clearly D' does not cover  $\mathbb{R}$ .

 $\therefore$  ( $\mathbb{R}$ ,  $\mathcal{T}$ ) is not compact.

**MEP** 

#### Problem 1

(Kuratowski's closure operator) Let X be a set,  $\mathcal{P}(X)$  be its powerset, and  $c: \mathcal{P}(X) \to \mathcal{P}(X)$  be a function that satisfies:

(i) 
$$c(\emptyset) = \emptyset$$

(ii) 
$$A \subseteq c(A), \forall A \in \mathcal{P}(X)$$

(iii) 
$$c(c(A)) = c(A), \forall A \in \mathcal{P}(X)$$

$$(iv) c(A \cup B) = c(A) \cup c(B), \forall A, B \in \mathcal{P}(X)$$

Show that the collection  $\mathcal{T} = \{X \setminus c(A) \mid A \in \mathcal{P}(X)\}$  is a topology over X, and that in this topology  $\overline{A} = c(A)$ ,  $\forall A \in \mathcal{P}(X)$ . Here  $\overline{A}$  is the closure of A in  $(X, \mathcal{T})$ .

#### **Proof:**

This proof is incomplete, but I left what I tried here as a little extra. My chosen 5 problems do not include this one :).

We claim that  $\emptyset$ ,  $X \in \mathcal{T}$ .

Note that  $c(X) \in \mathcal{P}(X)$  and  $X \in c(X)$  imply that c(X) = X. Then  $X \setminus c(X) = X \setminus X = \emptyset \in \mathcal{T}$ . Similarly, note that  $c(\emptyset) = \emptyset \Longrightarrow X \setminus c(\emptyset) = X \setminus \emptyset = X \in \mathcal{T}$ .

 $\therefore \emptyset, X \in \mathcal{T}.$ 

We claim that  $\mathcal{T}$  is closed under finite intersections.

Take  $U, V \in \mathcal{T}$ , then  $\exists A, B \in \mathcal{P}(X)$  such that  $U = X \setminus c(A)$  and  $V = X \setminus c(B)$ . Then:

$$U \cap V = (X \setminus c(A)) \cap (X \setminus c(B))$$

$$= X \setminus (c(A) \cup c(B))$$

$$= X \setminus c(A \cup B) \in \mathcal{T}$$
(2)

 $\therefore U\cap V\in\mathcal{T}.$ 

 $\therefore \mathcal{T}$  is closed under finite intersections, by induction.

## **Problem 2**

Let A be a subset of a topological space  $(X, \mathcal{T}_X)$ . Show that the following are equivalent:

$$(i)\inf\Bigl(\overline{A}\Bigr)=\emptyset.$$

(ii) 
$$X \setminus \overline{A}$$
 is dense in  $X$ .

$$\textit{(iii)}\ X \setminus \overline{\left(X \setminus \overline{A}\right)} = \emptyset.$$

$$(iv) A \subseteq \overline{\left(X \setminus \overline{A}\right)}.$$

## **Proof:**

$$((i) \Longrightarrow (ii))$$

Suppose that  $\operatorname{int}\left(\overline{A}\right) = \bigcup \left\{U \in \mathcal{T}_X \mid U \subseteq \overline{A}\right\} = \emptyset$ . Note that  $\overline{\left(X \setminus \overline{A}\right)} \subseteq X$ . We claim that  $X \subseteq \overline{\left(X \setminus \overline{A}\right)}$ . Take  $x \in X$  and  $U \in \mathcal{T}_X$  such that  $x \in U$ . Then  $U \neq \emptyset$ . Now suppose that  $U \subseteq \overline{A}$ , then  $U \subseteq \bigcup \left\{U \in \mathcal{T}_X \mid U \subseteq \overline{A}\right\} = \emptyset \Longrightarrow U = \emptyset$ , which is a contradiction. X

Then 
$$U \cap (X \setminus \overline{A}) \neq \emptyset \Longrightarrow x \in \overline{(X \setminus \overline{A})} \Longrightarrow X \subseteq \overline{(X \setminus \overline{A})}$$
.

$$\therefore \overline{\left(X \setminus \overline{A}\right)} = X.$$

 $\therefore X \setminus \overline{A}$  is dense in X.

$$((ii) \Longrightarrow (iii))$$

Suppose that  $X \setminus \overline{A}$  is dense in X, then  $\overline{\left(X \setminus \overline{A}\right)} = X$  by definition.

Then 
$$X \setminus \overline{\left(X \setminus \overline{A}\right)} = X \setminus X = \emptyset$$
.

$$\therefore X \setminus \overline{\left(X \setminus \overline{A}\right)} = \emptyset.$$

$$((iii) \Longrightarrow (iv))$$

Suppose that  $X \setminus \overline{\left(X \setminus \overline{A}\right)} = \emptyset$ . Then  $\overline{\left(X \setminus \overline{A}\right)} = X$ . But  $A \subseteq X$  by hypothesis.

$$\therefore A \subseteq \overline{\left(X \setminus \overline{A}\right)}$$

$$((iv) \Longrightarrow (i))$$

Suppose that  $A\subseteq \overline{(X\setminus \overline{A})}$ . Now suppose, by contradiction, that  $\operatorname{int}\left(\overline{A}\right)\neq\emptyset$ . Then  $\exists x\in\operatorname{int}\left(\overline{A}\right)\Longrightarrow\exists U\in\mathcal{T}_X$  such that  $x\in\underline{U\subseteq\overline{A}}$ . But  $x\in\overline{A}$  and  $\underline{U}$  neighborhood of x imply that  $U\cap A\neq\emptyset$ . So  $\exists y\in U$  such that  $y\in A\subseteq \overline{(X\setminus\overline{A})}$ . But now  $y\in\overline{(X\setminus\overline{A})}$  and U neighborhood of y imply that  $U\cap \overline{(X\setminus\overline{A})}\neq\emptyset$ . But this contradics the fact that  $U\in\overline{A}$ . X

$$\therefore$$
 int $(\overline{A}) = \emptyset$ .

**MEP** 

#### Problem 3

A subset of a topological space is a  $G_{\delta}$ -set if it is the intersection of countably many open sets. On the other hand, a subset of a topological space is an  $F_{\delta}$ -set if it is the union of countably many closed sets.

- (i) Let A be an  $F_{\delta}$ -set of a topological space  $(X, \mathcal{T}_X)$ . Show that there is a nested sequence of closed sets  $C_1 \subseteq C_2 \subseteq C_3 \subseteq \ldots$  such that  $A = \bigcup_{i=1}^{\infty} C_i$ .
- (ii) Show that every closed set in a metric space (X, d) is a  $G_{\delta}$ -set.

#### **Problem 4**

Let A, B be two non-empty subsets of  $\mathbb{R}$  with the usual topology. Define:

$$C := \{x + y \mid x \in A \land y \in B\}. \tag{3}$$

- (a) Show that, if A or B is open, then C is open.
- (b) Show that, if A and B are compact, then C is compact.

# Proof (a):

Suppose, without loss of generality, that  $A \in \mathcal{T}_{\varepsilon^1}$ . Now take  $(x+y) \in C$ , then  $x \in A$ , which is open, so  $\exists \delta \in (0,\infty)$  such that  $(x-\delta,x+\delta) \subseteq A$ .

We claim that  $D := ((x+y) - \delta, (x+y) + \delta) \subseteq C$ .

Take  $d \in D$ , then:

$$(x+y) - \delta < d < (x+y) + \delta$$

$$\Rightarrow x - \delta < d - y < x + \delta$$

$$\Rightarrow (d-y) \in (x - \delta, x + \delta) \subseteq A$$

$$\Rightarrow ((d-y) + y) \in C$$

$$\Rightarrow d \in C$$

$$(4)$$

- $\therefore D \subseteq C$
- $\therefore$  C is open.

**MEP** 

## Proof (b):

Suppose that A,B are compact. Then, by Tychonoff's Theorem,  $A\times B$  is compact when given the product topology. Note that the product topology  $\mathcal{T}_{A\times B}$  is a relative topology inherited from  $\mathbb{R}^2$ . Define a function  $\varphi:(A\times B,\mathcal{T}_{A\times B})\to(\mathbb{R},\mathcal{T}_{\varepsilon^1})$  by  $\varphi(a,b)=a+b$ . Note that this is a polynomial function, and thus continuous. Also note that:

$$\varphi(A\times B)=\{\varphi(a,b)\mid (a,b)\in A\times B\}=\{a+b\mid a\in A\wedge b\in B\}=C \tag{5}$$

But  $A \times B$  is compact and compactness is a continuous invariant.

 $\therefore$  C is compact.

**MEP** 

### Problem 5

(Intermediate value theorem) Let  $f:(X,\mathcal{T}_X)\to (\mathbb{R},\mathcal{T}_{\varepsilon^1})$  be a continuous function, where  $(X,\mathcal{T}_X)$  is connected. Show that if a,b are two points in X and if r is a real number lying between f(a) and f(b), then there is a  $c\in X$  such that f(c)=r.

## **Proof:**

Note that  $f^{-1}(\mathbb{R}) = X$ . Now, suppose, by contradiction, that  $\nexists c \in X$  such that f(c) = d. Then the previous equation still holds when you remove d from  $\mathbb{R}$ . That is:

$$f^{-1}(\mathbb{R} \setminus \{d\}) = f^{-1}((-\infty, d) \cup (d, +\infty)) = X \tag{6}$$

Now, let  $A := f^{-1}((-\infty, d))$ , and  $B := f^{-1}((d, +\infty))$ , and note that:

(i) 
$$a \in A \Longrightarrow A \neq \emptyset \land b \in B \Longrightarrow B \neq \emptyset$$

(ii) 
$$A \cup B = f^{-1}((-\infty, d)) \cup f^{-1}((d, +\infty))$$
  
=  $f^{-1}((-\infty, d) \cup (d, +\infty)) = X$  (7)

(iii) 
$$A\cap B=f^{-1}((-\infty,d))\cap f^{-1}((d,+\infty))$$
 
$$=f^{-1}((-\infty,d)\cap (d,+\infty))=f^{-1}(\emptyset)=\emptyset$$

Then  $\{A, B\}$  forms a separation for X, which is a contradiction. X

 $\therefore \exists c \in \mathbb{R} \text{ such that } f(c) = d.$ 

**MEP** 

#### Problem 6

Let  $(X_1, \mathcal{T}_1)$  and  $(X_2, \mathcal{T}_2)$  be topological spaces and suppose  $X_1 \times X_2$  has the product topology. For each i = 1, 2, let  $A_i \subseteq X_i$ . Prove that:

$$\textit{(i)}\ \overline{A_1\times A_2}=\overline{A_1}\times \overline{A_2}.$$

$$(ii) \operatorname{int}(A_1 \times A_2) = \operatorname{int}(A_1) \times \operatorname{int}(A_2).$$

#### Lemma 1:

Let  $C_1,C_2,D_1,D_2$  be sets. Then  $(C_1\times C_2)\cap (D_1\times D_2)=(C_1\cap D_1)\times (C_2\cap D_2).$ 

#### **Proof:**

Note that:

$$(x,y) \in (C_1 \times C_2) \cap (D_1 \times D_2)$$

$$\iff (x,y) \in (C_1 \times C_2) \wedge (x,y) \in (D_1 \times D_2)$$

$$\iff (x \in C_1 \wedge y \in C_2) \wedge (x \in D_1 \wedge y \in D_2)$$

$$\iff (x \in C_1 \wedge x \in D_1) \wedge (y \in C_2 \wedge y \in D_2)$$

$$\iff x \in (C_1 \cap D_1) \wedge y \in (C_2 \cap D_2)$$

$$\iff (x,y) \in (C_1 \cap D_1) \times (C_2 \cap D_2)$$

$$(8)$$

$$\therefore (C_1 \times C_2) \cap (D_1 \times D_2) = (C_1 \cap D_1) \times (C_2 \cap D_2)$$

# Proof (i):

Take  $(x,y)\in \overline{A_1\times A_2}$ , and take  $U_1\in \mathcal{T}_1, U_2\in \mathcal{T}_2$  such that  $x\in U_1$  and  $y\in U_2$ . Then  $(x,y)\in U_1\times U_2$  and  $U_1\times U_2\in \mathcal{T}_\Pi$  by the definition of the product topology (for finite products). But:

$$(x,y) \in \overline{A_1 \times A_2} \Longrightarrow (U_1 \times U_2) \cap (A_1 \times A_2) \neq \emptyset$$

$$\Longrightarrow \exists (x',y') \in (U_1 \times U_2) \cap (A_1 \times A_2)$$

$$\Longrightarrow (x',y') \in (U_1 \cap A_1) \times (U_2 \cap A_2)$$

$$\Longrightarrow x' \in U_1 \cap A_1 \wedge y' \in U_2 \cap A_2$$

$$\Longrightarrow U_1 \cap A_1 \neq \emptyset \wedge U_2 \cap A_2 \neq \emptyset$$

$$\Longrightarrow x \in \overline{A_1} \wedge y \in \overline{A_2}$$

$$\Longrightarrow (x,y) \in \overline{A_1} \times \overline{A_2}$$

$$(9)$$

$$\therefore \overline{A_1 \times A_2} \subseteq \overline{A_1} \times \overline{A_2}$$

Similarly, take  $(a,b)\in \overline{A_1}\times \overline{A_2}$ , and take  $U_1\times U_2\in \mathcal{T}_\Pi$  such that  $(a,b)\in U_1\times U_2$ . Then  $a\in U_1\in \mathcal{T}_1$  and  $b\in U_2\in \mathcal{T}_2$  by the definition of the product topology (for finite products). But:

$$(a,b) \in \overline{A_1} \times \overline{A_2} \Longrightarrow a \in \overline{A_1} \wedge b \in \overline{A_2}$$

$$\Longrightarrow U_1 \cap A_1 \neq \emptyset \wedge U_2 \cap A_2 \neq \emptyset$$

$$\Longrightarrow \exists a' \in U_1 \cap A_1 \wedge \exists b' \in U_2 \cap A_2$$

$$\Longrightarrow (a',b') \in (U_1 \cap A_1) \times (U_2 \cap A_2)$$

$$\Longrightarrow (a',b') \in (U_1 \times U_2) \cap (A_1 \times A_2)$$

$$\Longrightarrow (U_1 \times U_2) \cap (A_1 \times A_2) \neq \emptyset$$

$$\Longrightarrow (a,b) \in \overline{A_1 \times A_2}$$

$$(10)$$

$$\begin{split} & \therefore \overline{A_1} \times \overline{A_2} \subseteq \overline{A_1 \times A_2} \\ & \therefore \overline{A_1 \times A_2} = \overline{A_1} \times \overline{A_2} \end{split}$$

**MEP** 

# Proof (ii):

Note that, for any subset B of a topological space  $(Y, \mathcal{T}_Y)$ , we have that

 $z\in \mathtt{int}(B) \Longleftrightarrow \exists U\in \mathcal{T}_{\!Y} \text{ such that } z\in U\subseteq B.$  Here's a brief proof:

Take  $z \in \mathtt{int}(B) = \bigcup \{V \in \mathcal{T}_Y \mid V \subseteq B\} \subseteq B$ . This proves  $(\Longrightarrow)$ . Now suppose  $\exists U \in \mathcal{T}_Y$  such that  $z \in U \subseteq B$ , then  $U \in \bigcup \{V \in \mathcal{T}_Y \mid V \subseteq B\} = \mathtt{int}(B)$ . This proves  $(\Leftarrow)$ .

Now for the main proof. Take  $(x,y)\in \mathrm{int}(A_1\times A_2)$ , then  $\exists U_1\times U_2\in \mathcal{T}_\Pi$  such that  $(x,y)\in U_1\times U_2\subseteq A_1\times A_2\Longrightarrow x\in U_1\subseteq A_1$  and  $y\in U_2\subseteq A_2\Longrightarrow x\in \mathrm{int}(A_1)$  and  $y\in \mathrm{int}(A_2)$ . Then  $(x,y)\in \mathrm{int}(A_1)\times \mathrm{int}(A_2)$ .

 $\therefore \operatorname{int}(A_1 \times A_2) \subseteq \operatorname{int}(A_1) \times \operatorname{int}(A_2).$ 

Now take  $(a,b) \in \operatorname{int}(A_1) \times \operatorname{int}(A_2)$ , then  $a \in \operatorname{int}(A_1)$  and  $b \in \operatorname{int}(A_2) \Longrightarrow \exists U_1 \in \mathcal{T}_1$  such that  $a \in U_1 \subseteq A_1$  and  $\exists U_2 \in \mathcal{T}_2$  such that  $b \in U_2 \subseteq A_2$ . Then  $(a,b) \in U_1 \times U_2 \subseteq A_1 \times A_2$ , which implies that  $(a,b) \in \operatorname{int}(A_1 \times A_2)$ .

- $\therefore$  int $(A_1) \times$  int $(A_2) \subseteq$  int $(A_1 \times A_2)$ .
- $\therefore \mathtt{int}(A_1 \times A_2) = \mathtt{int}(A_1) \times \mathtt{int}(A_2).$

**MEP**
